SERVICE MANUAL

CS-1566A

DUAL TRACE OSCILLOSCOPE

TRIO

FEATURE

1566A1

Model CS-1566A Dual-Trace Oscilloscope is a high-performance, laboratory-quality instrument. Its performance, versatility, and operational features are designed to meet the needs of engineers and other advanced technologists in electronic research and design laboratories, test and analysis centers, and well-equipped service shops. The instrument is built for the professional who understands how to use scopes, with many operating conditions selected manually rather than automatically to permit greater versatility. For example, in dual-trace operation the sweep can be triggered by the CH1, CH2, LINE, or EXT signal, as manually selected by the user.

Performance features include DC to 20 MHz bandwidth (−3 dB) with smooth rolloff above 20 MHz to allow operation beyond 30 MHz, high sensitivity (5 mV/div), and calibration precision. Matched, dual vertical inputs permit simultaneous viewing of two waveforms. Chop or alternate sweep operation is manually selected. Add and subtract capability is also provided so that the sum or difference of two waveforms can be displayed as a single trace. The Channel 2 vertical input can be switched to become the horizontal input during X-Y operation; sensitivity of the horizontal axis equals that of the vertical axis.

Rectangular, domed, CRT provides constant electron beam length. Internal 8 × 10 division graticule reduces parallax error. Mesh type acceleration provides fine trace for accurate measurements.

For video applications such as video tape recorders, CATV and MATV networks, and television receivers, a built-in sync separator permits viewing of composite video waveforms.

Features like X10 magnification, electrical trace rotation (adjustable from the front panel), a slotted bezel for mounting a standard oscilloscope camera and the crisp, clean, modern styling will also be found.

SPECIFICATIONS

Cathode Ray Tube

Type:
C5S106P31B
Acceleration voltage:
2 kV
Scale:
8 div × 10 div (1 div = 9.5 mm)

Vertical Amplifier (for Both CH1 and CH2)

Deflection Factor:
5 mV/div to 20 V/div ± 5%
Attenuator:
12 steps in 1-2-5 sequence, 5 mV/div to 20V/div. With variable control for fully adjustable sensitivity between steps.
Input impedance:
1 MΩ ± 2%
Input capacitance:
27 pF ± 3 pF
Frequency response:
DC DC to 20 MHz (less than − 3 dB)
[5 mV/div ~ 10 V/div]
AC 2 Hz to 20 MHz (less than − 3 dB)
[5 mV/div ~ 10 V/div]
Risetime:
Less than 17.5 nsec.
Overshoot:
Less than 3% (at 100 kHz square wave)
Cross-talk:
ALT Less than − 60 dB
CHOP Less than − 50 dB
Operating modes:
CH1 CH1 only
CH2 CH2 only
ALT 2-channel with ALT (alternate sweep)
CHOP 2-channel with CHOP
ADD Single-trace algebraic sum of CH1 and CH2 (Single-trace algebraic difference of CH1 and CH2 when CH2 is inverted).
CHOP frequency:
Approx 200 kHz
Maximum input voltage:
600 Vp-p or 300 V (DC + AC peak)
Invert polarity:
CH2 only
Maximum undistorted amplitude:
More than 8 div (DC to 20 MHz)

Sweep Circuit

Sweep system:
Triggering sweep and auto sweep (free-running sweep at no signal time)
Sweep time:
0.5 μs/div to 0.5s/div (± 5%) in 19 ranges, in 1-2-5 sequence. Each overlapping range provides for fine adjustment.
Magnification:
10 times ± 5% (PULL × 10 MAG)
Linearity:
Less than 3% (2μs/div to 0.5s/div)
Less than 5% (0.5 μs/div to 1 μs/div)
Less than 10% (× 10 MAG)

Triggering

Source:
INT, CH1, CH2, LINE, EXT
Slope:
NORM Positive and negative
VIDEO Positive and negative (TV-H and TV-V automatically selected by SWEEP TIME/DIV)
TV-H (TV-line): 0.5 μs/div to 50 μs/div TV-V (TV-Frame): 0.1 ms/div to 0.5s/div
Sensitivity:

Trigger Type	Bandwidth	Minimum Sync Voltage	
		INT	EXT
NOR	50Hz ~ 15MHz 20Hz ~ 20MHz	0.5div 1.0div	0.5Vp-p 1.0Vp-p
AUTO	50Hz ~ 15MHz 20Hz ~ 20MHz	0.5div 1.0div	0.5Vp-p 1.0Vp-p
VIDEO	VIDEO signal	1.0div	1.0Vp-p

Horizontal Amplifier (CH2 input)

Operating modes:
X-Y mode is selected by SWEEP TIME/DIV.
CH1: Y axis
CH2: X axis
Deflection Factor:
Same as CH1 (5 mV/div to 20 V/div ± 5%)
Frequency response:
DC DC to 2 MHz (less than − 3 dB)
AC 2 Hz to 2 MHz (less than − 3 dB)
Input impedance:
Same as CH1 (1 MΩ ± 2%)
Input capacitance:
Same as CH1 (27 pF ± 3 pF)
X-Y phase difference:
Less than 3° at 70 kHz

Calibrating Voltage

0.1 Vp-p ± 3% at reference level 0 V. 1 kHz ± 3% square wave, positive polarity.

Intensity Modulation

Input voltage:
TTL compatible. Positive voltage increases brightness, zero voltage decreases brightness.

SPECIFICATIONS

Input impedance:
15 kΩ ±20%
Bandwidth:
DC to 5 MHz
Maximum input voltage:
50 V (DC + AC peak)

Trace Rotation

Trace angle is adjustable by panel surface adjuster.

Power Requirements

Power supply voltage:
100/120/220/240 V ±10%, 50/60 Hz
Power consumption:
47 W

Dimensions

Width:
260 mm (277 mm)
Height:
190 mm (204 mm)
Depth:
328 mm (393 mm)
Figures in ( ) shows maximum sizes.
Weight:
8.4 kg

Accessories

Probe (PC-22) 2
Attenuation: 1/10
Input impedance: 10 MΩ
Input capacitance: Less than 18 pF
Instruction manual 1
Replacement fuse
0.5 A 2
0.8 A 2

CRT C5S106P31B SPECIFICATION

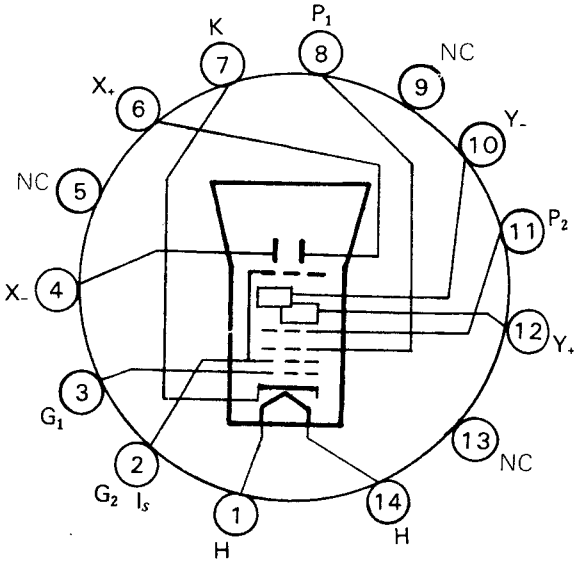
Dimensions:
Total length 335 Max. mm
Diagonal: Max 133±3 mm
Screen shape:
Rectangular, flat face, internal graticule
Focusing:
Electrostatic
Deflection:
Electrostatic
Fluorescence:
Green (Persistence: Medium short)
Display area:
100×80 mm²

Heater

Heater voltage:
6.3 V
Heater current:
0.3 A

Maximum Rating

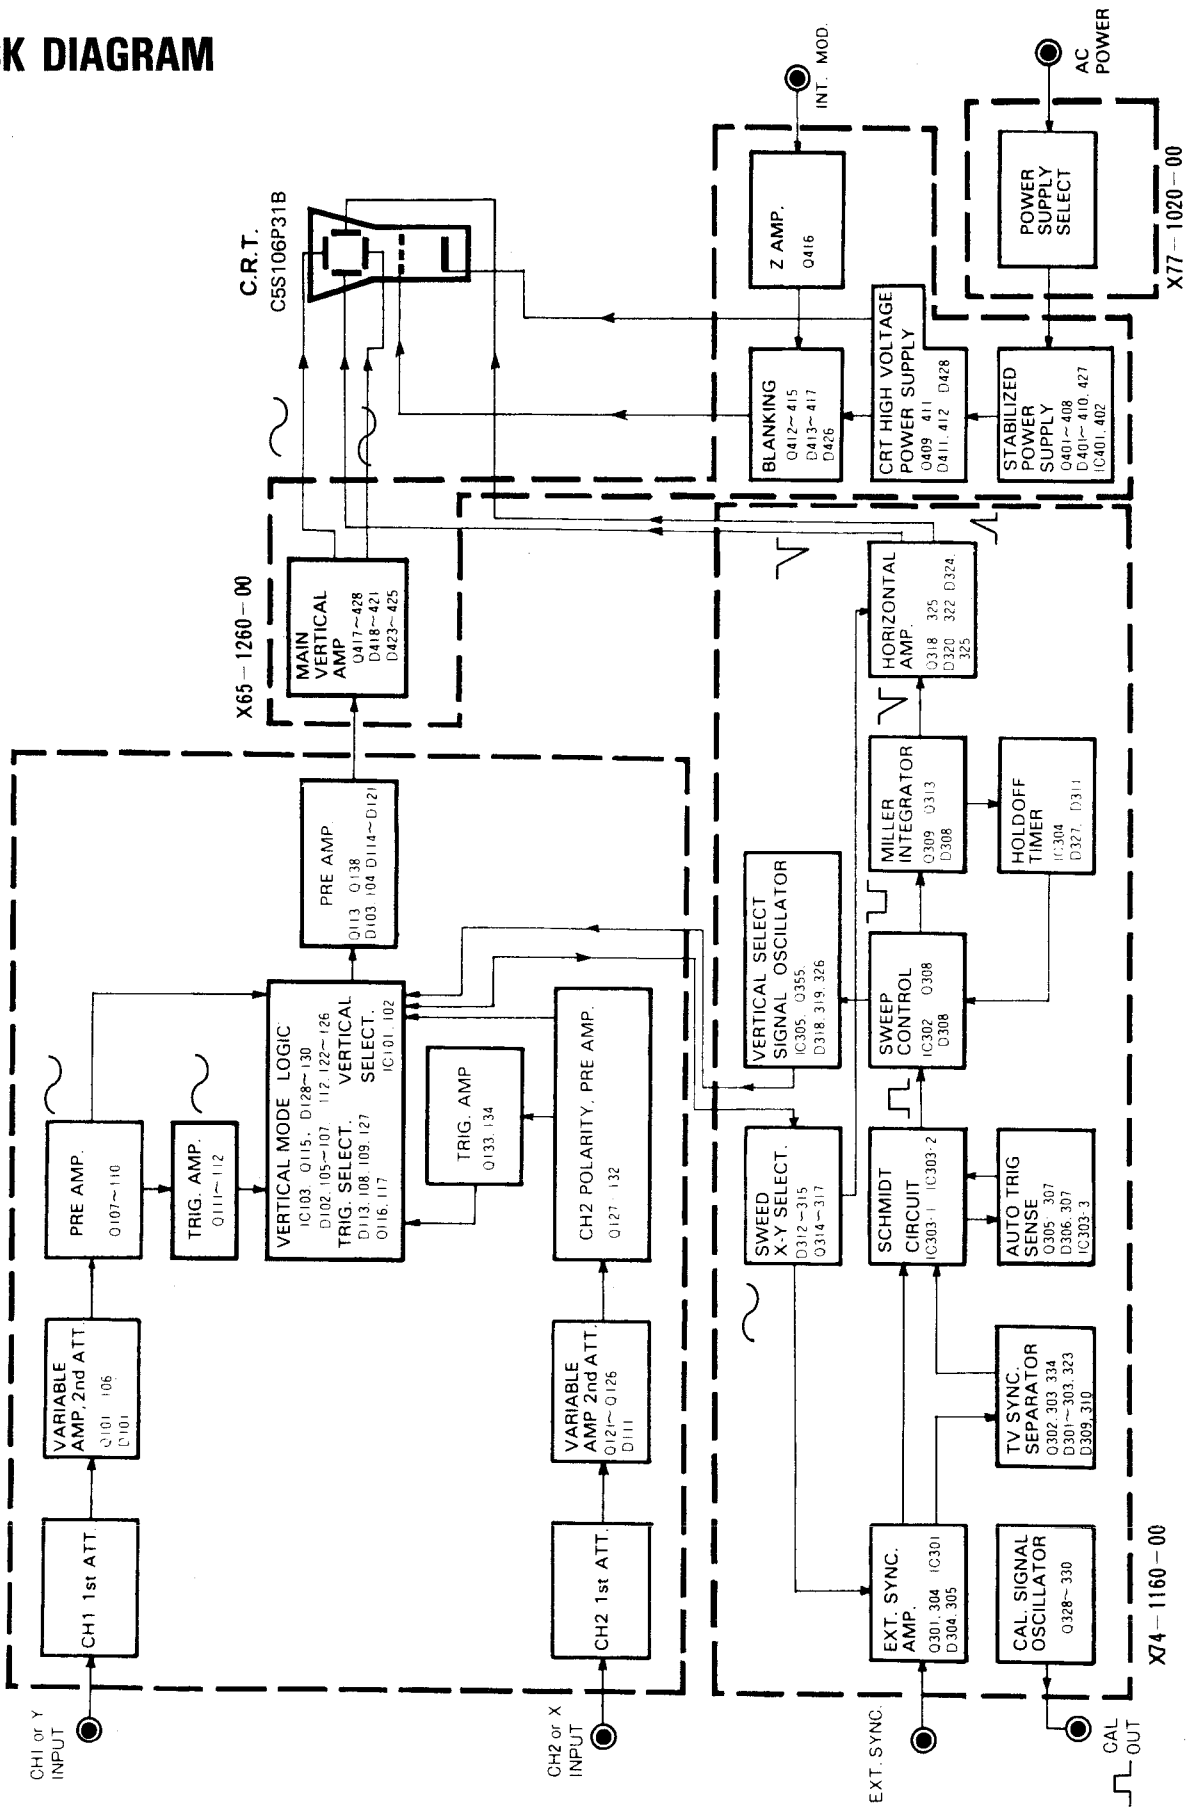
2nd plate voltage:
Max. 2000 V
2nd grid voltage:
Max. 2000 V



C5S106P31B Base Bottom

CIRCUIT DESCRIPTION

BLOCK DIAGRAM



CIRCUIT DESCRIPTION

VERTICAL AMPLIFIER

Two identical preamplifiers are used for CH1 and CH2. The signal applied to the BNC input is superposed on AC or DC component by the AC-GND-DC switch, attenuated to 1/1, 1/10, 1/100 or 1/1000 by the 1st attenuator according to the level of the signal, and fed to Q101a.

Q101a,b is a dual FET having excellent temperature balance characteristic. Q102 turns ON with a negative overvoltage to protect Q101a. VR101 is used to compensate for the characteristic of the DC element of the differential amplifier Q101—Q106 so that the 2nd attenuator S103 can be DC balanced. The signal passing through the source follower of Q101a is fed to the emitter follower of Q103 where the impedance is further lowered. This low impedance signal is then fed to the 2nd attenuator of Q106. The resistance across the emitters of Q105 and Q106 is switched by the 2nd attenuator to set the gain ratio to 1/1, 1/2 or 1/4. VR102 is a gain adjuster that varies the load resistance.

VR103 is a variable attenuator DC balance control. The signal from the 2nd attenuator is amplified by the cascode amplifier Q107—Q110. In CH2, the transistor on the grounded base side of the cascode amplifier has a switching function to invert the phase.

VR108 is vertical position control for CH1 and VR118 is for CH2. VR114 is vertical position control for CH2 INV.

IC101 is dual differential amplifier. It is a cascode circuit with a vertical mode selector circuit IC103 which selects the modes of dual signal operation using control signal. The signal from this circuit is sampled and amplified by Q111 and Q112 to obtain sync signal.

In X-Y mode, the CH2 amplifier also functions as X amplifier. The sensitivity is adjusted by VR117. The signal amplified by IC is further amplified by the drive amplifier Q113, Q114 and Q135—Q138. TC107 and VR106 are used to adjust high frequency response. VR107 is a balance control for the vertical output amplifier which is composed of the cascode circuit Q417 and Q419, the current regulator Q425 and Q427 as a load of the circuit, and the complementary type emitter follower Q421 and Q423. In this circuit, the current regulator is controlled by the output of the cascode amplifier to equivalently increase the product of gain and bandwidth.

TRIGGER AND SWEEP CIRCUITS

Sync signals for CH1 and CH2 from the vertical amplifier are selected by Q116. The signal selected passes through Q117, Q317 and Q301 and is further amplified by IC301. In X-Y mode, Q317 is OFF and the CH2 sync signal is amplified by Q316, which is then fed to the horizontal amplifier.

The signal amplified by IC301 is selected by S302 to determine the polarity and whether or not the signal is fed to the TV sync separation circuit. Then, it is fed through the buffer Q304 to the Schmidt circuit where it is shaped in square wave. The TV sync separation circuit clamps the emitter of Q302 to obtain only the sync signal for TV-H. When the circuit is integrated by R313 and C311, it produces sync signal for TV-V. The sync signal shaped by the Schmidt circuit is a clock pulse of the flip-flop IC302 which drives the mirror sweep circuit.

When the output of IC302 is inverted by the clock pulse, Q308 and D308 are OFF and the integration capacitors C321—C324 are charged with the constant current selected by Q309, Q310, and R335—R341 to produce saw-tooth wave having excellent linearity. The base potential of Q309 and Q310 is adjusted by VR303 to control the charging speed.

The mirror integrator output is properly sampled by VR305 and inputted to the comparator in IC304 and when the voltage increases to a given limit, the output of IC302 is inverted. Thus, the output of the mirror circuit is held in standby mode and, at the same time, the hold-off circuit (IC302) is triggered. Therefore, the hold-off period of IC302, which is determined by R331, R332 and C325—C328, is set with the clock pulse disregarded.

HORIZONTAL AMPLIFIER

The horizontal amplifier consists of Q318—Q325; the emitter follower, the common emitter and the cascode amplifier are cascade. Q321 is a current regulator. It improves CMRR of the differential circuit Q319 and Q320 to obtain the desired dynamic range of the horizontal amplifier. × 10 MAG is accomplished by changing the gain resistance across Q319 and Q320. The magnitude ratio is adjusted by VR310 and the magnitude position by VR309.

CRT CIRCUIT AND POWER SUPPLY CIRCUIT

The output of IC302 drives the vertical switching signal generator $IC305_{1,2}$. It is also used as unblanking signal which passes through the gate of IC305 and is amplified by Q412—Q415. This signal is DC regenerated and is fed to the grid of CRT.

The CRT's acceleration power supply circuit uses DC—DC converter which is a feedback type voltage regulator with an error amplifier Q409 and Q410 to produce - 1.9 kV.

Voltage of ± 10 V is obtained from the tracking regulator using the operation amplifier with zener diode D410 as an error amplifier.

Using − 10 V as a reference, + 21 V and + 170 V are stabilized. The high tension voltage of − 1.9 kV is stabilized using + 10 V as a reference.

MAINTENANCE

TRACE ROTATION ADJUSTMENT

Strong magnetic fields, present in many locations where an oscilloscope may be used, may cause the trace to be tilted. The degree of tilt may vary as the scope is moved from on location to another. The TRACE ROTATION control provides an electrically adjustable offset to compensate for trace tilt.

Perform the adjustment as follows.

1. Set oscilloscope controls to produce a horizontal trace with no input signal (triggering MODE switch in AUTO)
2. Use POSITION control as required to position the trace along a horizontal line of the graticule scale.
3. Adjust TRACE ROTATION so trace parallel with the reference line on the graticule scale.

AC VOLTAGE CONVERSION

When operating the unit on voltage other than 240 V, set AC voltage selector switch to 100 V, 120 V or 220 V according to your local AC current. The voltage selector switch is locate on the rear panel of the unit as indicated by the arrow mark. When operating on 100 V or 120 V, remove the 0.5A fuse and replace it with one rate at 0.8A.

REMOVING THE CASE

The case is removed in two sections. The top section can be lifted off after removing seven Phillips-head screws from the top and sides of the case. The bottom section can be lifted off after removing four Phillips-head screws from the bottom of the case.

WARNING

High voltage up to 2000 volts DC is present on the CRT and power supply board when the oscilloscope is operating. Up to 170 volts DC is present on all circuit boards except the vertical amplifier board. Line voltage (120 or 240 VAC) is present on the power transformer, on-off switch, fuse holder, and line voltage selector assembly any time the oscilloscope is connected to an AC power source, even if turned off. Always observe caution when the housing is removed from the unit. Contacting exposed high voltage could result in fatal electric shock.

PROBE COMPENSATION

Probe compensation adjustment matches the probe to the input of scope. For best result, compensation of both should be adjusted initially, then the same probe always used with CH1 and CH2 respectively. Probe compensation should be readjusted whenever a probe from a different oscilloscope is used, or CH1 and CH2 probes are interchanged.

1. Connect probes to both V. INPUT terminal.
   Connect ground clip of probes to oscilloscope ground terminal and touch tips of both probes to CAL 1 kHz ⎍⎍ 0.1 V_{p-p} terminal.
2. Select signal trace operation of CH1 and CH2 for steps 3 and 4.
3. Set oscilloscope control to display 3 or 4 cycles of CAL square wave at 5 or 6 divisions amplitude.
4. Adjust compensation trimmer on probe for optimum square wave, waveshape (minimum overshoot, rouding off and tilt).

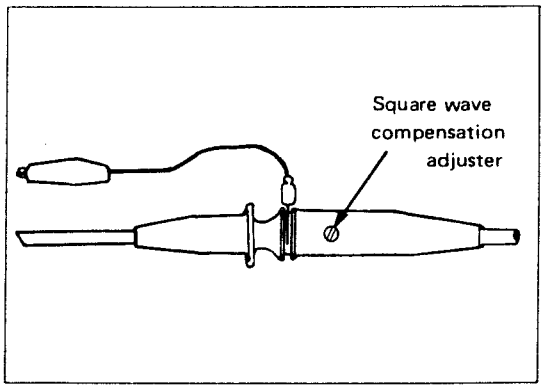


Fig. 1

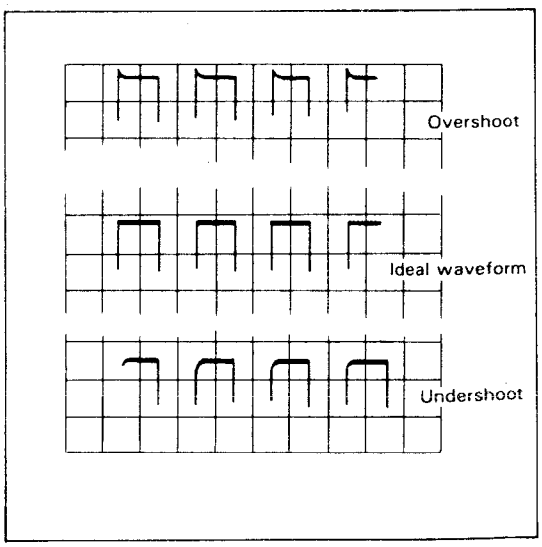

Fig. 2

MAINTENANCE

REPLACEMENT OF CATHODE RAY TUBE (CRT)

Caution:
The circuits around the CRT produce a voltage as high as 2000 V. To prevent electric shock, be sure to disconnect the power cord before replacing the CRT. Make certain that the circuits are fully discharged.

1. Remove the cases and molded cover.
2. Remove 2 screws from the CRT band holding the neck of the CRT shield.
3. Loosen 2 screws holding the CRT cover to the rear panel. Disconnect the white leads from the terminal pins.
4. Remove the CRT socket from the CRT. The CRT shield will now be removed completely from the main body.
5. Slide CRT shield and CRT backward and lift the CRT shield and slide the CRT forward to remove from the CRT shield.
6. The CRT is ready for removal. Replace it with a new one by following the above procedures in reverse order.
7. After replacing, make adjustments of ASTIG and others referring to the adjustment instructions.

REMOVING PRINTED CIRCUIT BOARD

Vertical amplifier board (X73-1280-00)

1. Remove 3 screws securing the board.
2. Unsolder the leads with resistors (R3, R4) from the BNC receptacles.
3. Remove VOLTS/DIV and SWEEP TIME/DIV knobs. Small knobs requires 1.5 mm Hex. screwdriver. Large knobs have two set screws.
4. Remove knobs from ▲▼ POSITION,◀▶POSITION, TRIG. LEVEL controls. Remove slotted hex. lock nuts and washers from shaft of ▲▼ POSITION,◀▶POSITION and TRIG. LEVEL controls.
5. Remove POWER, INTENSITY and FOCUS knobs. These knobs require 1.5 mm Hex. screwdriver.
6. Remove lever knobs from all the associated front panel lever switches.
7. Remove the decorative panel from the front panel.
8. Remove 2 screws securing the lever switch.
9. Gently remove board away from chassis and disconnected plugs P101 ~ P103. Power can be reapplied for testing and troubleshooting while board is removed from chassis by simply reconnecting P101 ~ P103.

Sweep circuit board (X74-1160-00)

1. Remove 3 screws securing the board.
2. Remove 2 screws securing the lever switches (SYNC and SOURCE).
3. Gently remove board away from chassis and disconnect plugs P301 ~ P310. Power can be reapplied for testing and troubleshooting while board is removed from chassis by simply reconnecting P301 ~ P310.

Power supply board (X68-1260-00)

1. Remove 4 screws securing the board and bracket from the rear escutcheon.
2. Disconnect plugs P401 ~ P408 from the board.
3. Disconnect the 2 white leads from the CRT to pin of the board.

ADJUSTMENT

Before making adjustment, perform the following notes.

1. Preset the scope controls as follow unless otherwise specified.
2. All adjustment should follow the following order.

Name of knob	Position
INTENSITY	3 o'clock
FOCUS	Optimum position
V. POSITION (CH1)	Mechanical center
H. POSITION	Push, Mechanical center
VARIABLE (both CH1 and CH2)	CAL
AC-GND-DC (both CH1 and CH2)	DC
TRIGGERING	PULL
SYNC	NORM (+)
SOURCE	INT
V. POSITION (CH2)	Push, Mechanical center
MODE	CH1
VOLTS/DIV (both CH1 and CH2)	5 mV

TEST EQUIPMENT REQUIRED

Test Equipment	Model	Minimum Specification
Digital Multi-Meter	DL-706 (TRIO)	Impedance: More than 10 MΩ, Measuring range: 0.01 V to 199 V
Sine-Wave Generator	651B (YHP)	Frequency: 10 Hz to 10 MHz, constant voltage over tuning range
Sine-Wave Generator	SG-503 (Tektronix)	Frequency: 50 kHz to 100 MHz, Output impedance: 50 Ω, constant voltage over tuning range.
Square-Wave Generator	PG-506 (Tektronix)	Output signal: 1 kHz, Amplitude: 10 mVp-p to 10 Vp-p, Accuracy: within ±1%, Rise time: 35ns or less
Q Meter	4343B (YHP)	—
Color Pattern Generator	CG-911 (TRIO)	—
Oscilloscope	465 (Tektronix)	Sensitivity: more than 5 mV Frequency response: More than 100 MHz
Time-Marker Generator	TG-501 (Tektronix)	Time mark: 0.5 s to 0.1μs repetive waveform
High-Voltage Probe	—	Input Impedance: 1000 MΩ
Termination	—	Impedance: 50 Ω Accuracy: within 3%
Termination	—	3 watts type impedance: 50Ω
Attenuator	—	−20dB attenuation (50Ω)

POWER AND CRT CIRCUIT ADJUSTMENT

−10 V adjustment

1. Connect a digital multimeter to measure the voltage at P403, pin 3 or P404, pin 4 with respect to the chassis.
2. Adjust VR401 for a −10 V reading on the multimeter.

−1.9 kV adjustment

1. Connect a digital multimeter of high input impedance to measure the voltage at P405, pin 3 with respect to the chassis.
2. adjust VR402 for a −1.9 kV reading on the multimeter.

Check

	Voltage rating	Location
170 V	161.5-178.5 V	P404-1pin
5 V	4.75-5.25 V	P404-3pin
10 V	9.5-10.5 V	P404-5pin

Astigmatism adjustment

1. Set the SWEEP TIME/DIV control to X-Y position and both CH1 and CH2 AC-GND-DC switches to GND position. This will produce a spot on the screen.
2. With the INTENSITY control set about mid-range, adjust both VR404 and the FOCUS controls for the sharpest, roundest spot.
   Do not readjust ASTIG control after this step.

INTENSITY adjustment

1. Pull the PULL AUTO knob to display a horizontal trace.
2. Adjust VR403 so that the trace disappears when the INTENSITY control setting is reduced to the 9 to 11 o'clock position.

Check

1. Apply 1 MHz sine wave signal to CH1 input to display 6 divisions vertical amplitude waveform on the screen.
2. The thickness at the start of the sweep should be equal to the thickness at the other points and no retrace should be obtained at the end of the sweep.

CRT centering adjustment

1. Short-circuit the test terminal P104 of the vertical final-stage.
2. Pull the PULL AUTO knob to display a trace.
3. Adjust VR107 to center the trace vertically.

Vertical geometry adjustment

1. Pull the PULL AUTO knob to display a trace and adjust ▲▼ POSITION control to the trace vertically.
2. Short the short terminal P104 and connect a digital multimeter to measure the voltage at P104 in P.C.B. X73-1280-00.
3. Adjust VR405 for approx. 70 V reading on the multimeter.

ADJUSTMENT

VERTICAL AXIS CIRCUIT ADJUSTMENT

VARI. ATT. BAL. STEP ATT. BAL., and V. POSITION adjustment

1. Set scope controls for a single horizontal trace on CH1 with the CH1 AC-GND-DC switch set to GND position and set the SWEEP TIME/DIV control to 1 ms position.
2. Rotate the CH1 VARIABLE control from maximum clockwise to maximum counterclockwise, while observing the trace.
3. If the trace moves vertically, adjust VR103 (VARI. ATT. BAL.) for minimum or zero vertical movement when performing step 2.
4. Rotate the CH1 VOLTS/DIV control through the 5 mV, 10 mV and 20 mV position while observing the trace.
5. If the trace moves vertically, adjust VR101 (STEP ATT. BAL.) for minimum or zero movement when performing step 4.
6. Repeat the entire procedure for CH2, adjusting VR113 for VARIABLE step balance and VR111 for VOLTS/DIV balance.
7. When the ▲▼ POSITION control is set to the mechanical center, adjust VR108 (▲▼ V. POSITION) so that the trace can be positioned in the center.
8. Repeat the entire procedure for CH2, adjusting VR118 for ▲▼ V. POSITION.

Check

1. With CH1 and CH2 POSITION controls at mechanical center (12 o'clock), each trace should be approximately centered vertically. Turning each POSITION control fully clockwise should move trace up at least 5 divisions from center, fully counterclockwise should move trace down at least 5 divisions from center.

NOR-INV POSITION adjustment

1. Set the MODE switch to the CH2 position and the CH2 AC-GND-DC switch to GND position.
2. Pull the PULL AUTO knob to display a trace.
3. Alternately pull and push the CH2 PULL INVERT knob, adjusting VR114 so that the trace does not shift when the polarity is reversed.

100 kHz square wave compensation

1. Rotate VOLTS/DIV control to 2 mV, MODE switch to CH2, SOURCE switch to CH2 and CH2 AC-GND-DC switch to AC.
2. Apply 100 kHz square wave signal through a 50 Ω terminator to CH2 input and adjust square wave generator for 6 divisions of 100 kHz signal on the screen.
3. Rotate SWEEP TIME/DIV control from 2 μs to 0.2 μs. Adjust TC704 (mid range) and VR703 (high range) for minimum overshoot (within 3%) and ringing (within 3%) at point ⓐ and ⓑ on waveform as shown in Fig.3.
4. Keeping the signal level constant, gradually decrease the input signal to 10 kHz. Amplitude should roll off gradually with no dip or peaks.

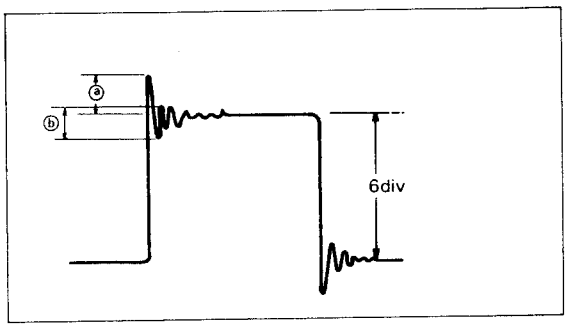

Fig. 3

1 kHz square wave compensation

1. With 1 kHz square wave signal applied set the SWEEP TIME/DIV control to 0.5 ms.
2. Adjust TC104 (10:1, 0.2 V), TC105 (100:1, 2 V), and TC106 (1000:1, 20 V) until the vertical amplitude reaches for exactly 4 divisions.
3. Repeat the entire procedure for CH2, adjusting TC114, TC115 and TC116.

Vertical gain adjustment

1. Set both CH1 and CH2, AC-GND-DC switches to DC and SWEEP TIME/DIV control to 0.5 ms.
2. Set both CH1 and CH2 VOLTS/DIV controls to 5 mV (VARIABLE to CAL) and apply a 20 mVp-p, 1 kHz square wave signal to CH1 input.
3. Adjust VR105 for exactly 4 divisions vertical amplitude waveform.
4. Repeat the entire procedure for CH2, adjusting VR116 for vertical gain adjustment.

Vertical gain adjustment

1. Set the MODE switch to the CH1 position.
2. Connect the CH1 input terminal to the CAL⎍0.1 V p-p terminal.
3. Set the CH1 VARIABLE control to the CAL position and the VOLTS/DIV control to 20 mV (probe set for DIRECT measurement).
4. Adjust VR105 for exactly 5 divisions vertical amplitude of 1 kHz square wave signal display.
5. Repeat the entire procedure for CH2, adjusting VR116.

Input capacity adjustment

1. Connect a Q meter to measure the input capacity at CH1 input terminal and check 27pF ± 3pF.
2. Rotate the VOLTS/DIV control through 5 mV, 50 mV and 0.5 V position, adjusting TC101, TC102 and TC103 so that the input capacity of each range is 27pF ± 3pF.
3. Repeat the entire procedure for CH2, adjusting TC111, TC112 and TC113.

ADJUSTMENT

HORIZONTAL AXIS CIRCUIT ADJUSTMENT

Sweep time and sweep length adjustments

1. Set MODE switch to CH1 and SWEEP TIME/DIV control to 1 ms.
2. Apply 1 ms marker signal to CH1 input.
3. Measuring the time period of the markers will assure calibration accuracy.
4 Adjust VR305 so that 11 visible markers occupy exactly 11 divisions of horizontal deflection as shown in Fig. 4.
5. Adjust VR304 for a total sweep length of 10 1/2 divisions.

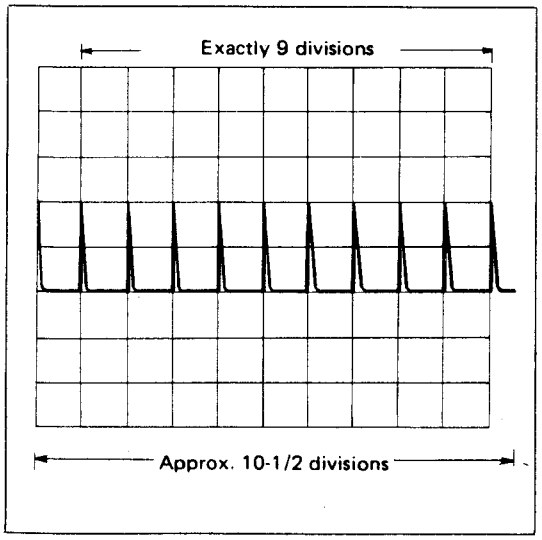

Fig. 4

Mag centering and mag gain adjustments

1. Set SWEEP TIME/DIV control to 1 ms and apply 1 ms marker signal to CH1 input to display 3 waves on the screen.
2. Pull ×5 MAG knob to magnify a trace and adjust VR310 so the center marker remains stationary whether the ×5 MAG knob is ON. Do not rotate the ◄► POSITION control.
3. Next, push ×5 MAG knob and adjust VR309 so that the 10 visible markers occupy exactly 10 divisions of horizontal deflection.
4. Recheck step 2. Repeat if required.

◄►H. POSITION adjustment

1. Set ◄► POSITION control at its mechanical center.
2. Rotate SWEEP TIME/DIV control to 0.2 ms and apply 1 ms marker signal to CH1 input to display 3 waves on the screen.
3. Adjust VR316 so the center marker remains stationary.

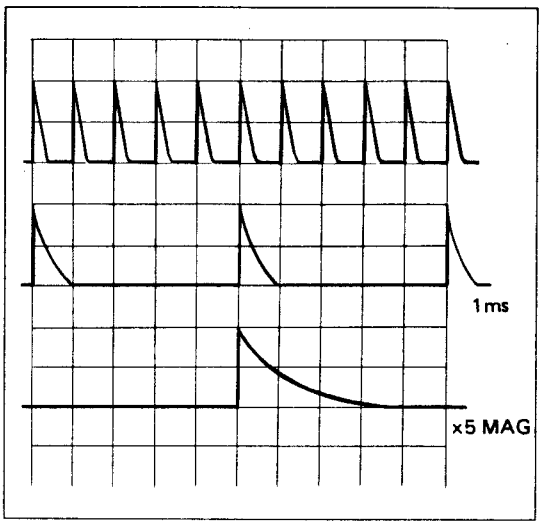

Fig. 5

Check

Turning ◄► POSITION control fully clockwise should move trace at least 5 divisions right from centered position, fully counterclockwise should move trace at least 5 divisions left from centered position.

5 μs, 0.5 μs ranges adjustments

1. Rotate SWEEP TIME/DIV control to 5 μs, 0.5 μs, gradually while appling the equal marker signal to CH1 input.
2. Adjust the following adjuster to duplicate the conditions shown in Fig. 4.

SWEEP TIME/DIV	Marker	Adj.
5 μs	5 μs	TC301
0.5 μs	0.5 μs	TC302

X gain and position adjustments

1. Rotate VOLTS/DIV control to 5 mV and set CH2 AC-GND-DC switch to AC.
2. Set MODE switch to X-Y. Apply a calibrated 1 kHz 20 mVp-p sine or square wave signal to CH2 input.
3. Adjust VR117 for exactly 4 divisions horizontal deflection between the 2 spots on the screen.
4. Next, set MODE switch to X-Y to display a spot on the screen.
5. Adjust VR307 to center the spot horizontally on the screen.

Linearity adjustment

1. Using ×10MAG, set the SWEEP TIME/DIV control to 0.5 μs and apply the CH1 input terminal to 0.5 μs marker signal.

ADJUSTMENT

2. With good sweep linearity, the screen should display 10 divisions, with each cycle having exactly equal horizontal deflection.
3. Adjust TC303 if needed for good sweep linearity.

SYNC. SLOPE and Triggering level adjustment

1. Set the SWEEP TIME/DIV control to 0.1 ms and connect the CH1 input terminal to 1 kHz sine wave signal.
2. Adjust the CH1 VOLTS/DIV control to obtain 6 divisions vertical amplitude on the CRT screen.
3. Check the waveform so that + sweep is triggered on positive-going slope of waveform as shown in Fig. 6-(a) and – sweep is triggered on negative-going slope of waveform as shown in Fig. 6-(b).
4. Adjust VR303 so that the start point of each waveform remain the same when the SYNC switch select + and – as shown in Fig. 6-(c).
5. Set the TRIGGERING LEVEL control to the mechanical center.
6. Adjust VR301 so that the start point of the waveform can be positioned in the center.

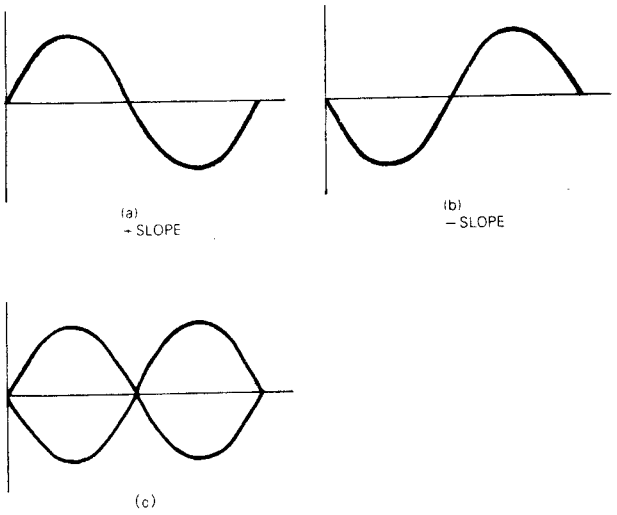

Fig. 6

CALIBRATING VOLTAGE ADJUSTMENT

1. A general check of calibration accuracy may be made by displaying the output of the CAL⎍0.1 V p-p terminal on the screen.
   This test signal has been factory-calibrated to provide an accurate square wave of 0.1 V p-p amplitude and 1 ms time duration per cycle.
2. At 20 mV/div this should produce exactly 5 divisions of vertical deflection on CH1 or CH2, or 5 divisions of horizontal deflection in X-Y operation when the VARIABLE controls are set to CAL. The 5 mV/div range may be used to check the 10:1 attenuation of the probe; exactly 2 divisions of deflection should result.
3. With a 0.1 ms/div sweep time and VARIABLE set to CAL, one cycle of the waveform should occupy exactly 10 divisions. At 1 ms/div sweep time, 10 cycles should exactly span the 10 divisions, while 1 cycle should cover the 10 divisions using ×10 MAG knob.
4. Perform the above procedures, then adjust VR312 (CAL symmetry adj.), VR313 (CAL frequency adj.) and VR314 (CAL voltage adj.)

TC-303	Sweep linearity (0.5 μs)

PERFORMANCE TEST

After calibration adjustments are completed, the following tests will check non-adjustable circuit to confirm that oscilloscope operation meets all specifications.
If unsatisfactory performance is indicated, service and repair is required.

Frequency Response Check

1. Apply 1 kHz sine wave signal to CH1 input and adjust for 6 divisions amplitude on the screen. Keeping the signal level constant, gradually increase the frequency from DC to 20 MHz. Amplitude should roll off gradually with no dips or peaks; at 20 MHz amplitude should be at least 4.3 divisions.
2. Check CH1 and CH2 independently.

Linearity

1. Apply 20 MHz sine wave signal to CH1 input and adjust for 4 divisions amplitude on the screen.
2. When increasing the signal level by two times, amplitude should be at least from 7.8 to 8.2 divisions.
3. Then apply 20 MHz sine wave and set oscilloscope controls to display waveform of 2 divisions amplitude in the center of the screen.
4. Using the ▲▼ POSITION control to move the display to the top and bottom of the screen, there should be no more than from 2.2 to 1.8 divisions change in amplitude.
5. Check CH1 and CH2 independently.

Crosstalk

1. Apply 1 kHz sine wave to CH1 and set oscilloscope controls to display 6 divisions amplitude. (VOLTS/DIV control to 1 V/DIV)
2. Set CH2 AC-GND-DC switch to GND. The CH2 VOLTS/DIV control may be left in any position. Set MODE switch to DUAL so that both channels may be observed.
3. Rotate CH2 VOLTS/DIV from the 1 V/div to 5 mV/div thru 5 mV/div. (overdrive channel 1). Observe CH2 for crosstalk. Crosstalk amplitude should be less than 1.9 mV.
4. Repeat step 1 thru 3 for CH2 to CH1 crosstalk.

X-Y Frequency Response Check

1. Rotate the SWEEP TIME/DIV control to X-Y position.
2. Apply 1 kHz sine wave signal to CH2 input and adjust for 10 divisions amplitude on the screen. Keeping the signal level constant, gradually increase the frequency from DC to 2 MHz. Amplitude should roll off gradually with no dips or peaks; at 2 MHz amplitude should be at least 7.1 divisions.

SYNC

Check synchronization circuit sensitivity according to the table below.

Trigger Type	Bandwidth	Minimum Sync Voltage	
		INT	EXT
NORM	50 Hz-15 MHz 20 Hz-20 MHz	0.5 div 1.0 div	0.5 Vp-p 1.0 Vp-p
AUTO	50 Hz-15 MHz 20 Hz-20 MHz	0.5 div 1.0 div	0.5 Vp-p 1.0 Vp-p
VIDEO	VIDEO	1.0 div	1.0 Vp-p

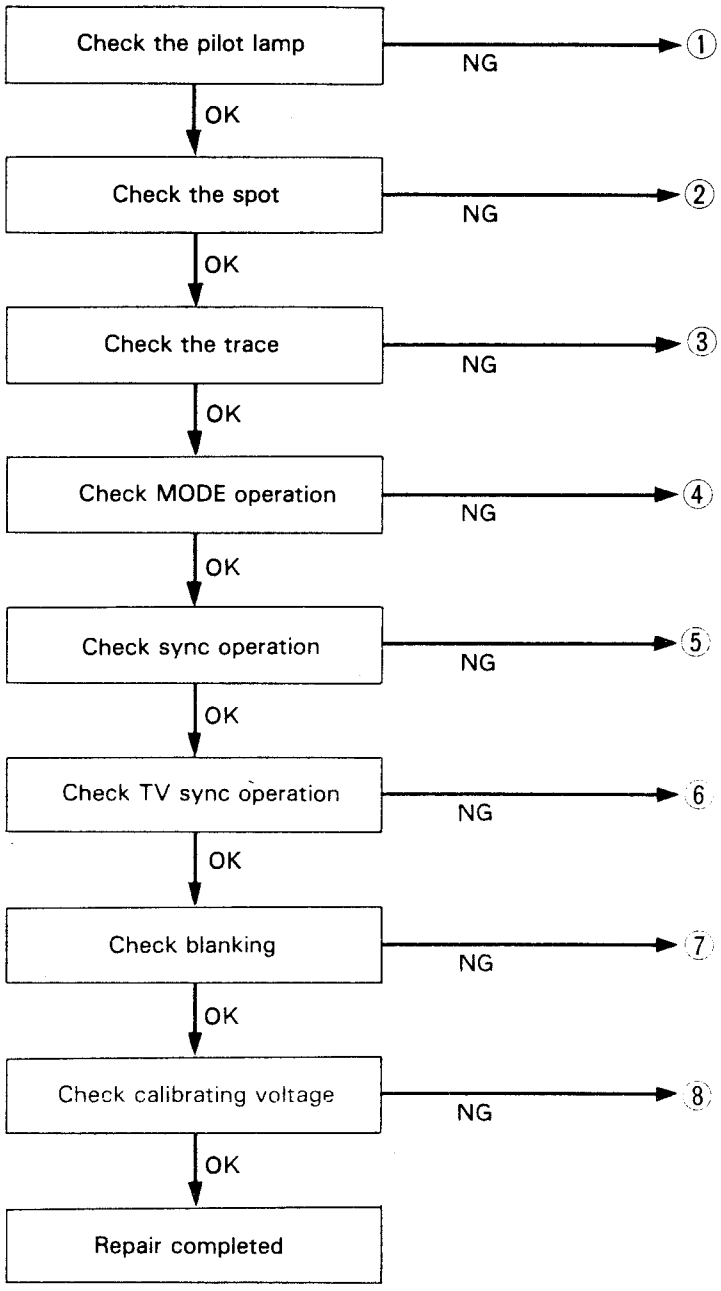
Intensity Modulation

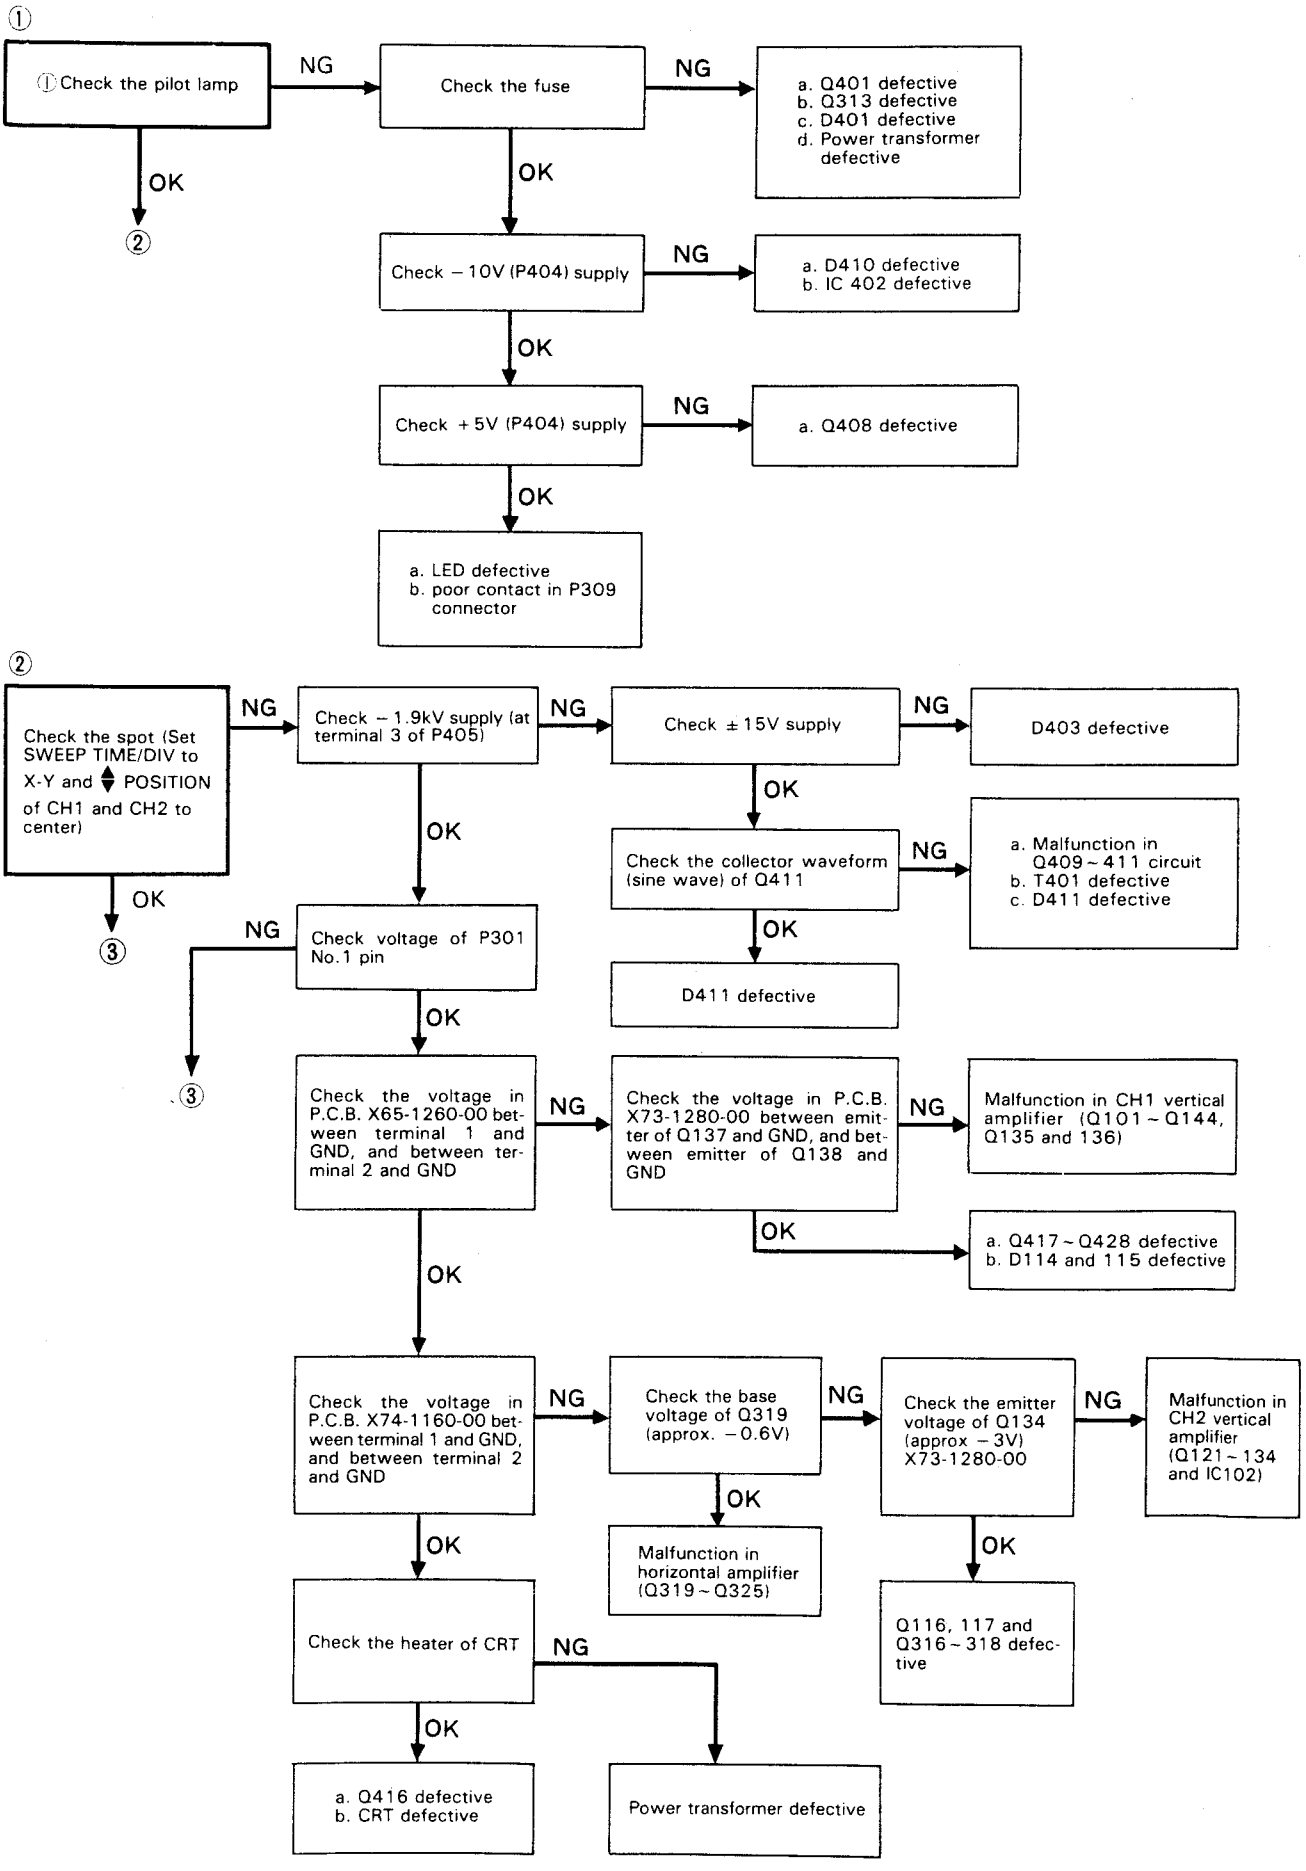
1. Set SWEEP TIME/DIV control to 1 ms and apply 1 kHz square wave to Z AXIS INPUT jack. To sync sweep, simultaneously apply square wave to EXT TRIG jack and use external sync.
2. Starting with square wave amplitude of approximately 10 volts, note intensity modulation (alternate bright and dim intervals on trace). Decrease amplitude of square wave to lowest level that gives clearly visible intensity modulation.
   Use low intensity to avoid masking effect. Intensity modulation should be visible at square wave levels of less than 5 volts peak-to-peak.

Hum Check

1. Set CH1 and CH2 AC-GND-DC switches to GND.
2. Hum should be less than 0.1 division on all sweep time and attenuator ranges.
3. Trace line shift should be within 0.3 division when AC-GND-DC switch is changed from one position to another.

TROUBLESHOOTING





①
① Check the pilot lamp
NG
Check the fuse
NG
a. Q401 defective
b. Q313 defective
c. D401 defective
d. Power transformer defective
OK
②
OK
Check – 10V (P404) supply
NG
a. D410 defective
b. IC 402 defective
OK
Check + 5V (P404) supply
NG
a. Q408 defective
OK
a. LED defective
b. poor contact in P309 connector
②
Check the spot (Set SWEEP TIME/DIV to X-Y and ▲▼ POSITION of CH1 and CH2 to center)
NG
Check – 1.9kV supply (at terminal 3 of P405)
NG
Check ± 15V supply
NG
D403 defective
OK

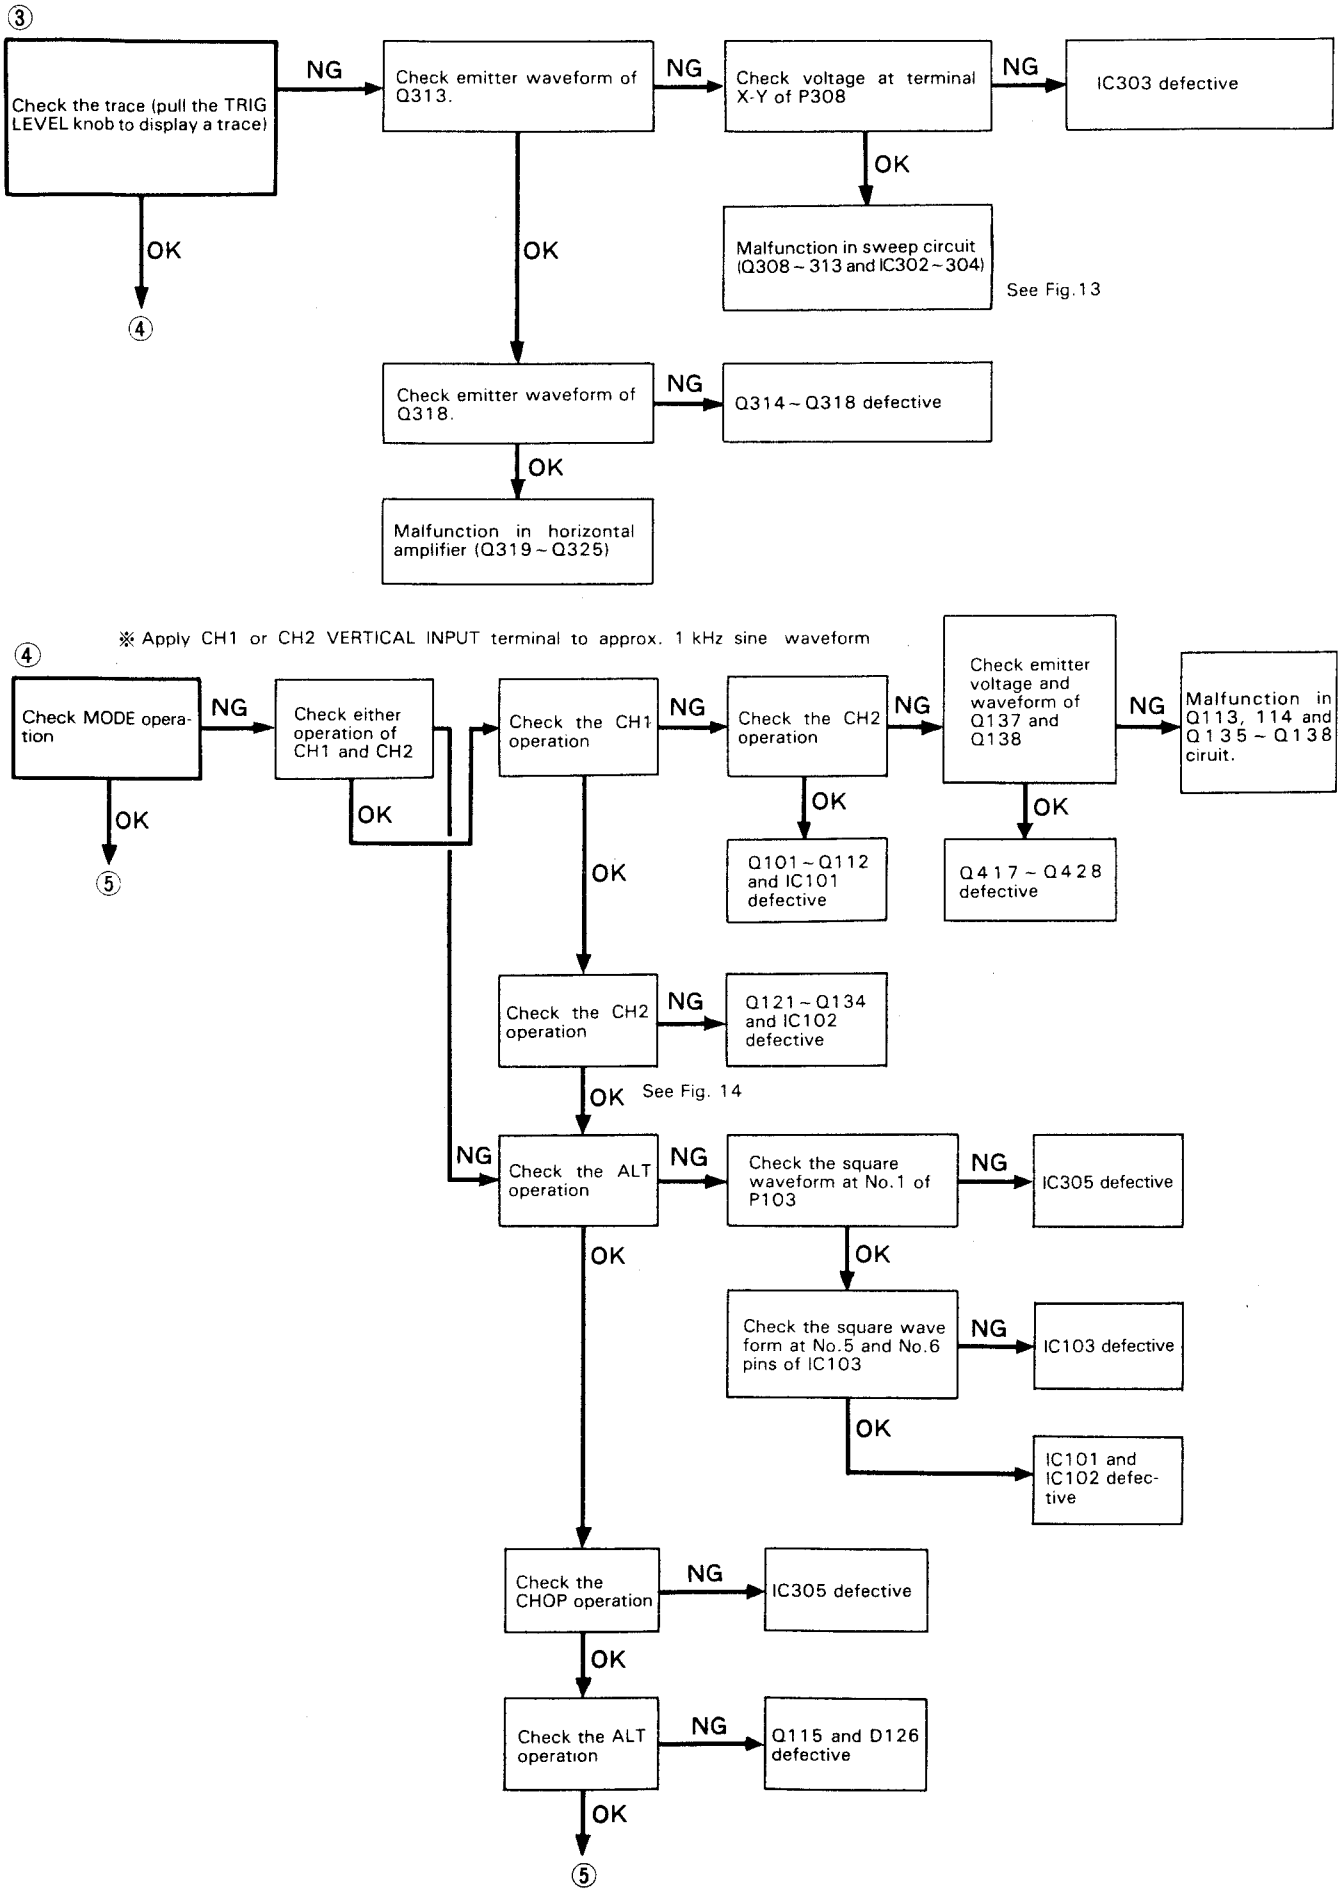
③
NG
Check voltage of P301 No.1 pin
D411 defective
OK
③
Check the voltage in P.C.B. X65-1260-00 between terminal 1 and GND, and between terminal 2 and GND
NG
Check the voltage in P.C.B. X73-1280-00 between emitter of Q137 and GND, and between emitter of Q138 and GND
NG
Malfunction in CH1 vertical amplifier (Q101 ~ Q144, Q135 and 136)
OK
a. Q417 ~ Q428 defective
b. D114 and 115 defective
OK
Check the voltage in P.C.B. X74-1160-00 between terminal 1 and GND, and between terminal 2 and GND
NG
Check the base voltage of Q319 (approx. – 0.6V)
NG
Check the emitter voltage of Q134 (approx – 3V) X73-1280-00
NG
Malfunction in CH2 vertical amplifier (Q121 ~ 134 and IC102)
OK
OK
OK
Malfunction in horizontal amplifier (Q319 ~ Q325)
OK
Q116, 117 and Q316 ~ 318 defective
Check the heater of CRT
NG
OK
a. Q416 defective
b. CRT defective
Power transformer defective



③
Check the trace (pull the TRIG LEVEL knob to display a trace)
NG
Check emitter waveform of Q313.
NG
Check voltage at terminal X-Y of P308
NG
IC303 defective
OK
OK
Malfunction in sweep circuit (Q308 ~ 313 and IC302 ~ 304)
See Fig.13
OK
④
Check emitter waveform of Q318.
NG
Q314 ~ Q318 defective
OK
Malfunction in horizontal amplifier (Q319 ~ Q325)
※ Apply CH1 or CH2 VERTICAL INPUT terminal to approx. 1 kHz sine waveform
④
Check MODE operation
NG
Check either operation of CH1 and CH2
Check the CH1 operation
NG
Check the CH2 operation
NG
Check emitter voltage and waveform of Q137 and Q138
NG
Malfunction in Q113, 114 and Q135 ~ Q138 ciruit.

Q417,418		Transistor 2SC1973(T)
Q419,420		Transistor 2SC805A-2(2) or (3)
Q421,422		Transistor 2SA923-2(2)
Q423,424		Transistor 2SC805A-2(2) or (3)
Q425,426		Transistor 2SA923-2(2)
Q427,428		Transistor 2SC1973(T)
Q429		Transistor 2SC983(Y)
IC401,402		Linear IC NJM4558D
		MISCELLANEOUS
L401	L40-4711-03	Ferri-inductor 470μH
L402	L40-4791-02	Ferri-inductor 4.7μH
—	E23-0046-04	Terminal
P401	E40-0632-05	Connector(6P)
P402,403	E40-0567-05	Connector(5P)
P404	E40-0867-05	Connector(8P)
P405	E40-0803-05	Connector(8P)
P406	E40-0303-05	Connector(3P)
P407	E40-0267-05	Connector(2P)
P408	E40-1267-05	Connector(12P)
P409	E40-0367-05	Connector(3P)
—	J30-0605-05	Spacer ×8
—	J61-0049-05	Cable wrapping band ×2
—	F01-0818-05	Heat sink
—	F01-0231-14	Heat sink
—	F02-0031-05	Heat sink
—	F11-0938-13	Shield case
—	J21-2885-04	Bracket (for P.C. Board)
—	J25-2851-62	Printed circuit board
—	J30-0605-05	Spacer
T401	L19-0407-05	Converter transformer
N401,402	NE-2B	Neon lamp
—	R92-0150-05	Jumper wire (resistor type)

VOLTAGE SELECTOR UNIT (X77-1020-00)

Ref. No.	Parts No.	Description
—	J25-2805-14	Printed circuit board
—	J12-0501-14	Mold pin
—	F19-0703-04	Changeover switch plate
—	E08-1081-05	Receptacle
—	E09-0681-05	Plug
—	E23-0047-04	Terminal
—	E40-0233-05	Pin connector 2p
—	E40-0533-05	Pin connector 5p
—	E40-0635-05	Pin connector 6p
